Define SQL statements directly	3

Create DM sample table as CSV file and other files

This script creates the result and codelist for a simple DM table.

Get the data and prepare for derivation of summary statistics

```
library(devtools)

library(foreign)
library(sqldf)

xptdirectory<- tempdir()

fnadsl<- paste(xptdirectory,"/", "adsl", ".xpt",sep="")

download.file("http://phuse-scripts.googlecode.com/svn/trunk/scriptathon2014/data/adsl.xpt", fnadsl)

adsl<- read.xport(fnadsl)
adsl$TRT01A<- as.character(adsl$TRT01A)
adsl$RACE<- as.character(adsl$RACE)
adsl$SAFFL<- as.character(adsl$SAFFL)
adsl$SEX<- as.character(adsl$SEX)

## SASxport package maps characters and dates etc into more R like data type
## install.packages("SASxport")
## library(SASxport)
## adsl<- as.data.frame(read.xport(fnadsl,as.is=TRUE))
## str(adsl)
```

Create frame for cube from an existing RDF data cube

The code input a turtle file with an RDF data cube. SQL statements for calculating the measurements are derived from the cube, and used to derive the summary statistics. Note: the SQL statements does not show records where the combination of values lead to 0 observations. This is handled below, in a not so clever way. A better approach would be to include the concept of a skeleton in the SQL statements.

```
library(rrdfqbcrrnd0)

dataCubeFile<- system.file("extdata/sample-rdf", "DC-DM-sample.TTL", package="rrdfqbcrrnd0")
checkCube <- new.rdf(ontology=FALSE) # Initialize
load.rdf(dataCubeFile, format="TURTLE", appendTo= checkCube)
summarize.rdf(checkCube)
```

[1] "Number of triples: 1192"

```
stmtSQL<- GetSQLFromCube(checkCube)

cat(stmtSQL$summStatSQL)
```

```

in.text<- paste0(
  paste(
    paste0("insert into qbframe ", "(", paste0(names(stmtSQL$qbframe),collapse=", "), ")\\n" ),
    "values\\n",
    paste0( "(", apply(stmtSQL$qbframe,1,function(x) {paste0("'",x,'" ', collapse=",")}), ") ", collapse="\\n"
  ),";\\n")

se.text<- "select * from qbframe;"

tempfile<- file.path(tempdir(),"temp-code.R")
cat(paste('res.text<- "', res.text,"\\n",collapse="\\n"), file=tempfile)
cat(paste("cr.text<- '", cr.text,"\\n",collapse="\\n"), file=tempfile,append=TRUE)
cat(paste("in.text<- '", in.text,"\\n",collapse="\\n"), file=tempfile,append=TRUE)
cat(paste("se.text<- '", se.text,"\\n",collapse="\\n"), file=tempfile,append=TRUE)
print(tempfile)
```

[1] "/tmp/RtmpiOJJpw/temp-code.R"

Define SQL statements directly

The statements below are inserted from the file generated above.

Work-around: add SELECT statments below corresponding to the desired statistics. Update the .csv file, and re-create the cube. Repeat until done. This is of course not the ideal way; waiting to the formular interface to the cube.

```
res.text<- "
