Preliminaries	1
R-code	1

Preliminaries

When developing, the script is intended to run from the package root after the setup for development as defined in the README.md.

```
knit(input="inst/data-raw/create-qb-IC-dataset.Rmd",  
      output="inst/data-raw/create-qb-IC-dataset.md")
```

R-code

```
library(RCurl)
library(XML)
library(devtools)

qbURL<-"http://www.w3.org/TR/2014/REC-vocab-data-cube-20140116/"
if (! url.exists(qbURL) ) {
  stop(paste0("Can not access URL ",qbURL))
}

# Acknowledgement: I got the approach from
# http://stackoverflow.com/questions/1395528/scraping-html-tables-into-r-data-frames-using-the-xml-pack

webpage <- getURL(qbURL)
# The following two lines is suggested in the stackoverflow post
# Apparently not needed here
## Process escape characters
## webpage <- readLines(tc <- textConnection(webpage)); close(tc)

# Parse the html tree, ignoring errors on the page
pagetree <- htmlTreeParse(webpage, error=function(...) {}, useInternalNodes = TRUE)

# appears that integrity checks starte with h3 and then a table with class bordered-table
```

```

# so that's what we look for
both<- getNodeSet(pagetree,"//*[h3[@id]]//*[table[@class='bordered-table']/tbody/tr/td/pre")

qbIClist<- list()

for (i in 1:(length(both)-1)) {
  icname<- xmlGetAttr(both[[i]],"id",default="none")
  if (grepl('ic-[1-9]([0-9])*', icname ) ) {
    ictitle<- xmlValue(xmlChildren(both[[i]])$text )
    # print(paste0( "Node ", i, ", IC name ", icname, " - ", ictitle ))
    qbIClist[[icname]]<- paste0(
      paste0("# ", ictitle, "\n" ),
      xmlValue(xmlChildren(both[[i+1]])$text),
      sep="\n"
    )
  }
}

```

Here are the integrity constraints:

```

for (icname in names(qbIClist)) {
##   fileConn<-file(paste0(icname, ".rq"))
  cat( qbIClist[[icname]] )
##   close(fileConn)
}

```

```

```

Data are stored in the data directory, following [R packages by Hadley Wickham](#) and [Writing R Extensions](#).
knit runs the script in the data-raw directory, so it would be expected to use pkg=“../..” to store the qbIClist
in the data directory However, it did not work - hence the setwd below-

```
devtools::use_data(qbIClist,pgk="../..",overwrite=TRUE)
```

```
# This stores the qbIClist in the data directory  
# Consider making it internal
```

```
devtools::use_data(qbIClist,overwrite=TRUE)
```

```
## Saving qbIClist to data/qbIClist.rda
```

```
print("Done")
```

```
[1] "Done"
```
