

# Using Python to make SPARQL queries

*mja@statgroup.dk*

*2016-05-16*

## Contents

<b>Using Python with SPARQL scripts for the demographics cube (DC-DEMO-sample.ttl)</b>	<b>1</b>
Requirement . . . . .	1
Get dimensions . . . . .	1
Get attributes . . . . .	2
Get observations . . . . .	2
Get definition for all descriptive statistics . . . . .	56
Get definition for descriptive statistics median . . . . .	57
Get information for selection of data . . . . .	57

## Using Python with SPARQL scripts for the demographics cube (DC-DEMO-sample.ttl)

The examples below uses `rdflib` from (<https://github.com/RDFLib/rdflib>).

As of 28-jun-2015 the code is still in development.

### Requirement

The python package `rdflib` must be installed, see description at (<https://github.com/RDFLib/rdflib>).

### Get dimensions

```
from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOdimensions.rq", "r") as myfile:
    dimensionsQuery=myfile.read()
qres = g.query(dimensionsQuery)
for row in qres:
    print("%s" %row)
```

```
## INFO:rdflib:RDFLib Version: 4.2.0
## http://www.example.org/dc/dimension#agegr1
## http://www.example.org/dc/dimension#procedure
## http://www.example.org/dc/dimension#sex
## http://www.example.org/dc/dimension#trt01a
```

```
## http://www.example.org/dc/dimension#factor
## http://www.example.org/dc/dimension#race
## http://www.example.org/dc/dimension#ethnic
```

## Get attributes

```
from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOattributes.rq", "r") as myfile:
    attributesQuery=myfile.read()
qres = g.query(attributesQuery)
for row in qres:
    print("%s" %row)
```

```
## INFO:rdflib:RDFLib Version: 4.2.0
## http://www.example.org/dc/attribute#denominator
## http://www.example.org/dc/attribute#colno
## http://www.example.org/dc/attribute#rowno
## http://www.example.org/dc/attribute#measurefmt
## http://www.example.org/dc/attribute#cellpartno
## http://www.example.org/dc/attribute#unit
```

## Get observations

The SPARQL script shows for each observation the dimension, attributes and measures in a row. The python code shows each variable on a line - that is not the right way to do it.

```
from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOobservations.rq", "r") as myfile:
    observationsQuery=myfile.read()

qres = g.query(observationsQuery)

for row in qres:
    for t in row:
        print("%s" %t)
```

```

## Get definition for all descriptive statistics

The SPARQL script shows how the function definition for the descriptive statistics is stored in the cube.

```

from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOprocedure.rq", "r") as myfile:
    procedureQuery=myfile.read()
gres = g.query(procedureQuery)
for row in gres:
    print("%s| %s| %s" %row)

```

```
