

Using Python to make SPARQL queries

mja@statgroup.dk

2016-02-03

Contents

Using Python with SPARQL scripts for the demographics cube (DC-DEMO-sample.ttl)	1
Requirement	1
Get dimensions	1
Get attributes	2
Get observations	2
Get definition for all descriptive statistics	242
Get definition for descriptive statistics median	242
Get information for selection of data	243

Using Python with SPARQL scripts for the demographics cube (DC-DEMO-sample.ttl)

The examples below uses `rdflib` from (<https://github.com/RDFLib/rdflib>).

As of 28-jun-2015 the code is still in development.

Requirement

The python package `rdflib` must be installed, see description at (<https://github.com/RDFLib/rdflib>).

Get dimensions

```
from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOdimensions.rq", "r") as myfile:
    dimensionsQuery=myfile.read()
qres = g.query(dimensionsQuery)
for row in qres:
    print("%s" %row)
```

```
## INFO:rdflib:RDFLib Version: 4.2.0
## http://www.example.org/dc/dimension#agegr1
## http://www.example.org/dc/dimension#procedure
## http://www.example.org/dc/dimension#factor
## http://www.example.org/dc/dimension#race
```

```
## http://www.example.org/dc/dimension#ethnic
## http://www.example.org/dc/dimension#sex
## http://www.example.org/dc/dimension#trt01a
```

Get attributes

```
from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOattributes.rq", "r") as myfile:
    attributesQuery=myfile.read()
qres = g.query(attributesQuery)
for row in qres:
    print("%s" %row)
```

```
## INFO:rdflib:RDFLib Version: 4.2.0
## http://www.example.org/dc/attribute#cellpartno
## http://www.example.org/dc/attribute#unit
## http://www.example.org/dc/attribute#colno
## http://www.example.org/dc/attribute#denominator
## http://www.example.org/dc/attribute#rowno
## http://www.example.org/dc/attribute#measurefmt
```

Get observations

The SPARQL script shows for each observation the dimension, attributes and measures in a row. The python code shows each variable on a line - that is not the right way to do it.

```
from rdflib import Graph
g = Graph()
g.parse("../extdata/sample-rdf/DC-DEMO-sample.ttl", format="turtle")
with open("../extdata/sample-rdf/DEMOobservations.rq", "r") as myfile:
    observationsQuery=myfile.read()

qres = g.query(observationsQuery)

for row in qres:
    for t in row:
        print("%s" %t)
```

```
