Contents

Create turtle version of ADSL dataset	1
Setup	1

Create turtle version of ADSL dataset

Setup

```
devtools::load_all(pkg="../..")
```

```
## Loading rrdqbcrndex
```

This script creates a turtle version of the ADSL dataset.

The script uses SQLite to export the ADSL dataset, and d2rq (<http://d2rq.org/>) to create a turtle version of the file. In the code below it is assumed that d2rq is installed in the directory `/opt/d2rq-0.8.1`.

```
library(foreign)
fnadsl<- system.file("extdata/sample-xpt", "adsl.xpt", package="rrdfqbcrndex")
adsl<-read.xport(fnadsl)
```

The present code uses `read.xport` to input the sas dataset. TODO: Date variables are not handled correctly. Other methods are available allowing access to more of the meta data in the datasets.

Next step is to dump the data as a SQL dump, that will serve as input to D2RQ. For dumping the data `sqlite` is used as it is the easiest to setup. The R-package `RSQLite` (<http://cran.r-project.org/web/packages/RSQLite/RSQLite.pdf>) provides access to `sqlite`.

```
## install.packages("RSQLite")
```

The SQL dump is created by transferring the R data.frame to SQLite, and then invoking `sqlite` to create a dump.

```
library(RSQLite)
## create a SQLite instance and create one connection.
m <- dbDriver("SQLite")
## initialize a new database to a tempfile and copy some data.frame
## from the base package into it
tfile <- tempfile()
con <- dbConnect(m, dbname = tfile)
dbWriteTable(con, "adsl", adsl)
```

```
## [1] TRUE
```

```
dbDisconnect(con)
```

```
## [1] TRUE
```

```
cat("SQLite database stored as ", tfile, "\n")
```

```
## SQLite database stored as /tmp/Rtmp3PKSIB/file222b5987d673
```

```
dumpFn<- tempfile()
system(paste("sqlite3", tfile, ".dump >", dumpFn, sep=" "))
cat("SQLite database dump in ", dumpFn, "\n")
```

```
## SQLite database dump in /tmp/Rtmp3PKSIB/file222b1c1eff3e
```

Next step is to process the dump, so the SQL can be used as input to d2rq. The changes applied are: * change TEXT to VARCHAR(1000) * remove top 2 lines with PRAGMA * in insert statements replace “adsl” with adsl * after “MMSETOT” REAL add a comma (“,”) and a new line with PRIMARY KEY (USUBJID)

This could maybe be simplified using RSQLite on dbSendQuery-methods, see (<https://stat.ethz.ch/pipermail/r-sig-db/2010q1/000813.html>). For d2rq documentation see (<file:///opt/d2rq-0.8.1/doc/dump-rdf.html>).

```
dumpAfterSedFn <- tempfile()
sedCmd<- paste("sed",
               "-e 's/TEXT/VARCHAR(1000)/g; s/\"MMSETOT\" REAL/\"MMSETOT\" REAL, PRIMARY KEY (USUBJID)/'",
               dumpFn, ">", dumpAfterSedFn, sep=" ")
system(sedCmd)
cat("SQLite database dump modified stored as ", dumpAfterSedFn, "\n")
```

```
## SQLite database dump modified stored as /tmp/Rtmp3PKSIB/file222b48c2377e
```

```
## Check only expected changes were applied
## not run due to large output
## system(paste("diff", dumpFn, dumpAfterSedFn, sep=" "))

adslmapttlFn<- file.path(tempdir(), "adsl-map.ttl")
adslttlFn<- file.path(tempdir(), "adsl.ttl")

d2rqbaseURL<- "http://www.example.org/datasets/"

## -b option does not work with -l
## /opt/d2rq-0.8.1/generate-mapping reports Unknown argument: -b
system(paste("/opt/d2rq-0.8.1/generate-mapping",
              "-l ", dumpAfterSedFn,
              "-o ", adslmapttlFn,
              ))

system(paste("/opt/d2rq-0.8.1/dump-rdf",
              "-b ", d2rqbaseURL,
```

```

        " -o ", adslttlFn,
        " -l ", dumpAfterSedFn,
        " ", adslmapttlFn
    ))

targetDir<- system.file("extdata/sample-rdf", package="rrdfqbc rnd0")
if (file.copy(adslmapttlFn, targetDir, overwrite = TRUE)) {
cat( "File ", adslmapttlFn, " copied to directory ", targetDir, "\n")
}

```

```
## File /tmp/Rtmp3PKSIB/adsl-map.ttl copied to directory /home/ma/projects/R-projects/rrdfqbc rnd0/rrdfqbc
```

```

if (file.copy(adslttlFn, targetDir, overwrite = TRUE)) {
cat( "File ", adslttlFn, " copied to directory ", targetDir, "\n")
}

```

```
## File /tmp/Rtmp3PKSIB/adsl.ttl copied to directory /home/ma/projects/R-projects/rrdfqbc rnd0/rrdfqbc
```

```

### This could maybe also work ..
## m <- dbDriver("SQLite")
## tfile <- tempfile()
## con <- dbConnect(m, dbname = tfile)
## s <- sprintf("create table %s(%s, primary key(%s))", "adsl",
##             paste(names(adsl), collapse = ", "),
##             paste(names(adsl)[c(1,2)], collapse=", "))
##             )
## dbGetQuery(con, s)

## dbWriteTable(con, "adsl", adsl,append=TRUE)
## dbDisconnect(con)
## tfile

```

Read in the file

This section demonstrates how to access the data for the ADSL dataset.

First the data are loaded into a RDF model.

```

dataFilemap<- system.file("extdata/sample-rdf", "adsl-map.ttl", package="rrdfqbc rnd0")
dataFilemap

```

```
## [1] "/home/ma/projects/R-projects/rrdfqbc rnd0/rrdfqbc rnd0/inst/extdata/sample-rdf/adsl-map.ttl"
```

```

dataFile<- system.file("extdata/sample-rdf", "adsl.ttl", package="rrdfqbc rnd0")
dataFile

```

```
## [1] "/home/ma/projects/R-projects/rrdfqbc rnd0/rrdfqbc rnd0/inst/extdata/sample-rdf/adsl.ttl"
```

```
store <- new.rdf() # Initialize
invisible(load.rdf(dataFilemap, format="TURTLE", appendTo= store))
invisible(load.rdf(dataFile, format="TURTLE", appendTo= store))
summarize.rdf(store)
```

```
## [1] "Number of triples: 13160"
```

Next step is to make a query showing the mappings

```
mapping.rq<-"
prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
prefix xsd: <http://www.w3.org/2001/XMLSchema#>
prefix d2rq: <http://www.wiwiss.fu-berlin.de/suhl/bizer/D2RQ/0.1#>
prefix jdbc: <http://d2rq.org/terms/jdbc/>
select * where {
  ?mapColumn a d2rq:PropertyBridge ;
              d2rq:column ?d2rqcolumn .
  optional{ ?mapColumn d2rq:datatype ?d2rqdatatype }
}
"

cat(mapping.rq,"\n")
```

```
##
## prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
## prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
## prefix xsd: <http://www.w3.org/2001/XMLSchema#>
## prefix d2rq: <http://www.wiwiss.fu-berlin.de/suhl/bizer/D2RQ/0.1#>
## prefix jdbc: <http://d2rq.org/terms/jdbc/>
## select * where {
##   ?mapColumn a d2rq:PropertyBridge ;
##             d2rq:column ?d2rqcolumn .
##   optional{ ?mapColumn d2rq:datatype ?d2rqdatatype }
## }
##
```

```
resmapping<- data.frame(sparql.rdf(store, mapping.rq),stringsAsFactors=FALSE)
str(resmapping)
```

```
## 'data.frame':   48 obs. of  3 variables:
## $ mapColumn   : chr  "file:///home/ma/projects/R-projects/rrdfqbc rnd0/rrdfqbc rndex/inst/data-raw/#ADSL_USUBJID"
